

ABSTRACT OF THE DISCLOSURE

A system and method provides synchronization verification of multiple applications across remote systems. In particular, the system has local application sharing logic to receive events to be shared from a local application, having at least one local application window, and to transmit the events to be shared to remote application sharing logic. The remote application sharing logic receives events to be shared from the local application sharing logic and transmits the events to at least one corresponding remote application for processing. The at least one corresponding remote application has at least one remote application window. A window synchronization verification logic correlates the at least one local application window with the at least one remote application window.
